Abstract

- Concern about risks associated with medical care has led to increasing interest in quality improvement processes.

- Most quality initiatives derive from manufacturing, where they have worked well in improving quality by small, steady increments.

- Adaptations of quality processes to the healthcare environment have included variations emphasising teamwork; large, ambitious increments in targets; and unorthodox approaches.

- Feedback of clinical information to clinicians is a central process in many quality improvement activities.

- It is important to choose feedback data that support the objectives for quality improvement — and not just what is expedient.

- Clinicians need to be better educated about the quality improvement process to maintain the quality of their care.
